

## Project

SPIRE-05-2015

### **ADREM**

**Full Title:** Adaptable Reactors for Resource- and Energy-Efficient Methane Valorisation

### **Aim:**

In ADREM, leading industries and university groups in process intensification, catalytic reactor engineering and process control team up to address the domain of resource- and energy-efficient valorisation of variable methane feedstocks to C<sub>2</sub>+ hydrocarbons.

**Concept:** In order to converge to the optimal design, the project will utilize the unique integral, four-domain process intensification (PI) methodology, pioneered by the consortium. This is the only approach able to deliver a fully intensified equipment/process. The key feature is the systematic, simultaneous addressing of the four domains: spatial, thermodynamic, functional and temporal.

**Start date:** 1 October, 2015

**End date:** 30 September, 2019
